BULBS FOR FALL DELIVERY

FORCING SNAPDRAGONS

Our selection of varieties, we believe, includes the best of the new varieties as well as the reliable standard sorts. The quality of the seed is such as to grow you a profitable crop.

STARTING YOUR "SNAPS"

For earliest winter crop sow seed in June or early July, planting into the benches in August. Sowing seed in August will produce plants ready to set in benches after "snaps" in November. Another sowing in January will produce plants ready to set in March and flower in May.

Seed started in June gives quicker and better germination than later real hot weather sowings.

Martin's Calceolarias

Knowing the importance of Calceolarias to the grower, we have exercised more than the usual care in selecting suitable varieties, and strains of seed of those varieties. Cremers Prize Cinerarias

Originators seed

Next to the Multiflora Nana, the Cremers is the most popular and in some sections it is preferred. The Cineraria grower really needs both strains. Cremer's produces plants of good saleable height with masses of small to medium sized flowers in a great variety of color. The flowers are fancy and bi-colored. The petals are broads and overlapping, and the habit of the plant and the comparative small size of the leaves make it possible to produce saleable plants in smaller pots than other strains. Mr. Cremer is providing us with his finest selection of seeds. Tr. Pkt. \$1.50, $\frac{1}{4}$ oz. \$2.25, $\frac{1}{32}$ oz. \$4.00, $\frac{1}{16}$ oz. \$7.50.

Annual Larkspur

Martin's Excellent Strains for the Florist

Larkspurs are much desired for both the outdoors and greenhouse crops. Seed started indoors in September will result in good blooms for February cutting. Another sowing in late November or early December, flowers in May and June. The last spring sowing outdoors is usually made in June first or before as the seed does not germinate readily during hot weather without special treatment. As Larkspur is a hardy annual, seed sown in the fall will come up and winter over all right in the vicinity of Cleveland and to the South.

Train to perpendicular habit and support like Carnations. The result is a wealth of bloom from December, well into the spring. **Introducers Trade Pkts. \$2.00, 3 for \$5.00. Order now. New crop seed will be sent to you in June.**

Germination of Pansy Seed

New crop seed is used as soon as available. If you delay sowing until hot weather in July and August, select as cool a spot as possible. STOCK, GIANT IMPERIAL SHASTA

Doubleness In Stocks

While the parentage and quality of the seeds effects the percentage of doubleness in Stocks, there are other factors also which have a bearing on the quality of the spikes you grow. Selection of the most vigorous seedlings and those showing serrated leaves will increase your percentage of doubles. Stocks grow best in a temperature of 48 to 50 degrees and warmer temperatures are liable to cause blindness. Experiments have shown that precooling the young plants (when showing about 4 leaves) for two weeks in a temperature of 40 degrees will result in earlier flowers and better spikes. A high nitrogen content in the soil is another factor favorably influencing doubleness.

Schizanthus

Knowing the value of Schizanthus to the florist we are specializing in it and believe we have for you the very best strains of seed to be obtained. Schizanthus is in demand as a cut flower and as a pot plant. The graceful delicately tinted flowers are unlike any others. Normally the regular flowering time in the greenhouse is in May but this may be advanced to March or even February by the use of additional light. Sow seed in September and October for earliest crop.
